Used ChatGPT for the dancing cats image

Swing dancing cats

Used Canva AI for the dancing cats video

Generate a video of cats swing dancing for advertising purposes

Used ChatGPT for the code scaffolding

Need your help to generate an AI-scaffolding section for my website advertising a weekly event and weekly lessons. Please make a pricing block

Changed:

Personalized the code to be about my event

Removed a combined option for event+lesson pricing and changed the css so it was a grid of 2 instead of 3

Deleted several lines of CSS (namely those that were unused after tweaking the HTML and those that pertained to color or font)

Ethical Guardrails

Disclose: There is a disclosure at the foot of the page

Verify: I checked and tested the code

Respect Copyright: I didn't instruct the AI to copy anyone or anything

Respect Privacy: I didn't use or give any personal information

Take Responsibility: I've disclosed and taken responsibility for my use of AI

Reflection

AI definitely saved me the most time in the website pricing block section. I suppose that it might've taken technically longer to make an image or video of that exact quality, but I like to draw and could easily use (and likely would use if this were a real-life scenario) a stock or generic image or video rather than an AI-generated one. The AI-coded pricing block looked appealing and discretely AI rather than obviously AI, I was impressed.

It cost me some time having to go through the AI's website output and personalize it, changing the CSS output and whatnot. I'm not completely satisfied with the video so I could've spent more time prompting to get a 'better' one but honestly I didn't think it was worth it, the technology isn't quite there yet (at least not from Canva!)

Something I'd do differently next time is probably not use AI at all. I find AI-generated images and videos unbelievably ugly and the coding turned out appealing but was difficult for me to parse. If I'm making a website I want to easily understand how it does what it does so that I'm able to update it without an issue, and I learn and understand the code best when it’s code I myself have written - which I understand is an issue I might still be having if I was, say, maintaining a website coded by someone else, but AI does things so quickly and you're able to pass it off so easily as being 'your own work' that I just worry it would cause problems for me. If I hired somebody to write code, I want them to be able to explain what each line of code does. So my ethical concern about AI in design work is really that people might get hired who are efficient at prompting AI to write code for them or knowing where to use that code but maybe not actually understanding the code itself, which I feel could pose problems down the line.
